

the best-kept secret in autism treatment is **Oxytocin**.

Oxytocin is "the love hormone." It's produced in the hypothalamus of the brain and released into the bloodstream by the pituitary gland. Its main function is to facilitate childbirth and breastfeeding which is one of the reasons it is called "the love drug" or "love hormone."

It is also released during long hugs and intimate moments including orgasms with your lover.

Oxytocin, like endorphins or serotonin, is a hormone in your body that promotes positive feelings.

Oxytocin can be taken as an Rx. You can either get a gel-like pill to melt on your tongue or you can get a nose spray. Either way, it's AMAZING.

Fallon took Oxytocin for several months to assist in her trauma therapy. Not only did it help in healing some big stuff quickly but it reset her Social Anxiety thermometer by going to the root- her dysregulated nervous system.

Fallon learned of Oxytocin from a few of her mentors who have been prescribing Oxytocin as a treatment for autism for over ten years.

They have witnessed depressed, non-verbal autistic children become happy, sociable, and radically verbally expressive within just weeks of the treatment!

If you are not seeing a MAPS-certified practitioner yet, we urge you to do so. They will gladly tell you more.

However, if you ask your pediatrician for an Oxytocin Rx and they gladly hand it over, that would be AMAZING!! It's just not as common for non-functional medicine doctors to feel comfortable prescribing it despite the fact that it is 100,000,000X safer to try than SSRIs, SNRIs, and amphetamines.

Whatever research you do, be mindful that PubMed.gov is the only organization that showcases peer-reviewed research articles. You can learn more about OXYTOCIN and [AUTISM here.](#)
